SRN: PES1UG24CS348

Section: F

OpenAPI Mock Server : Use Case Flow Specification

Use Case ID: UC-01

Use Case Name: Upload OpenAPI Specification

Primary Actor: API Developer

Related Use Case: «include» Generate Mock Endpoints (UC-02)

Preconditions:

1. The API Developer has a valid OpenAPI 3.0 .yaml or .json file ready.
2. The Mock Server application is running and accessible via browser.
3. The API Developer is authenticated and logged into the system.

Postconditions:

1. All paths and methods in the spec are registered as live mock endpoints.
2. The dashboard displays the full list of generated endpoint URLs.
3. The system is ready to receive and respond to mock API requests.

Main Success Scenario:

Step	Actor	Action
1	API Developer	Navigates to the Mock Server web interface and clicks "Upload Specification".
2	API Developer	Selects and uploads a .yaml or .json OpenAPI 3.0 file.
3	System	Validates the uploaded file against the OpenAPI 3.0 schema standard.
4	System	Parses all defined paths, HTTP methods, and response schemas from the spec.
5	System	Generates a live mock HTTP endpoint for each path-method combination.
6	System	Displays the list of generated endpoint URLs on the dashboard.
7	API Developer	Copies an endpoint URL and sends a test HTTP request.
8	System	Returns a randomized schema-compliant JSON response with HTTP 200 OK.

9	—	Use case ends successfully.
---	---	-----------------------------

Alternate Flow — 3a: Invalid Specification File

Step	Actor	Action
3a1	System	Detects a structural or schema error in the uploaded file (e.g., missing required info field).
3a2	System	Displays a human-readable error message identifying the invalid field and line number.
3a3	API Developer	Corrects the file based on the error message.
3a4	API Developer	Re-uploads the corrected file.
3a5	—	Flow resumes from Step 3 of the Main Success Scenario.
